COURSE DESCRIPTIONS

BMEN 301 INTRODUCTION TO BIOMEDICAL ENGINEERING

This course provides an overview of applications of engineering in medicine. Topics covered include basic biology and engineering problems associated with living systems and health care delivery; introduction to biomedical problems using fundamental concepts and tools from electrical, mechanical, and chemical engineering. Examples will be used to illustrate how basic concepts and tools of science and engineering can be brought to bear in understanding and simulation of biological processes.

BMEN 467 MUSCULOSKELETAL BIOMECHANICS

This course presents an integrated approach to the study of human movement. Fundamental mechanical principles will be reviewed, with subsequent application to the major joints and structures of various regions of the human body, resulting in an understanding of and appreciation for total body movement and the integration of biomechanics with other exercise and sport science disciplines.

ELCP 211 ENGINEERING DRAWING

This course prepares students to use AutoCAD to create complete, concise, and accurate engineering drawings. Students will also use the AutoCAD Electrical Toolset that offers automated drafting tools for designing wiring, circuiting, PLC modules, panels and more. They will also learn the interface and the workflow of developing accurate electrical schematics and drawings.

ELCP 290 INTRODUCTION TO THE ENGINEERING DESIGN FUNDAMENTALS 3.0: 1cr. E

This course serves as a general introduction to the engineering profession, its main objectives, and concerns. It introduces the engineering design process, its phases, challenges and constraints, the qualities, and attributes of a modern-day engineer as expected by professional engineering societies, including integrity, professionalism, ethical commitment, and environmental requirements, as well as the role of the engineer in society. In addition, students will be introduced to project management skills, technical writing, and effective multidisciplinary teamwork. The course aims to set students on the way to future design and professional work in Electrical and Computer Engineering.

ELCP 391 SENIOR DESIGN 1

This course constitutes the first semester of a year-long culminating senior design project. In the course, small groups of two to four students are requested to form multidisciplinary teams and solve a relatively open-ended engineering design problem. Each team follows an iterative design process to propose a system/solution that meets the desired requirements, specifications, and constraints. The design should abide to the appropriate realistic constraints i.e., ethical, environmental, financial, safety health and technical, as well as the set standards, codes, and protocols. Students employ engineering design tools, documentation and previously acquired Engineering, Science and Mathematics knowledge for the complete conceptual phase of the design process. Namely, (1) understanding and formulating the problem (objectives, scope, elements, purpose), (2) define the design constraints and specifications (3) Performing a literature review and gathering the appropriate technical documentations, (4) analyzing the various components of the system, (5) selecting the appropriate hardware/software needed and (6) proposing a solution. At the end of the semester, teams will present a detailed design and convey to the public their findings through a comprehensive report that synthesizes all steps of the design process and exhibits individual team members' contributions.

Pre-requisites: ELCP 290, LISP 200, GENG 221, GENG 222

0.3: 2 cr. E

3.0: 3 cr. E

0.3: 1 cr. E

Extract from FOE Catalogue 2023/2024 version 5.0

ELCP 392 SENIOR DESIGN 2

This course constitutes the second semester of a year-long culminating senior project. In this sequel course to ELCP391, the teams of students must complete the chosen capstone projects to complete the second phase of the design process namely, (1) carry on the culminating design by synthesis and analysis, and (2) build, test, and evaluate the physical/virtual model. At the end of the semester, teams will present/demonstrate their final design prototype/product and convey to the public their findings through a comprehensive report and presentation that synthesizes all steps of the design process and exhibits individual team members' contributions.

Pre-requisite: ELCP 391

ELEN 201 INSTRUMENTATION LAB

This laboratory provides an introduction on the use of multi-meters, oscilloscopes, function generators, power supplies and other instrumentation. Applications include solenoids, resistors, capacitors, periodic signals analysis, RC, RL, and RLC circuits; balanced bridge circuit.

ELEN 202 ELECTRICAL SIMULATION AND DESIGN

This course introduces electrical engineering students to static electric and magnetic fields basic laws such as Coulomb, Faraday, Gauss, Ampere, Biot-Savart, and boundary conditions which leads to the ability of deriving Maxwell's equations. In addition, deep theoretical insights will be given to electromagnetic related issues such as energy, potential, current, magnetic force/torque, magnetic vector potential, and magnetic circuits.

Co-requisite: ELEN 221 Pre-requisites: CSIS 200 or CSIS 206

ELEN 221 CIRCUITS ANALYSIS I

This course provides students with a basic understanding of electrical circuit theory. Topics covered include fundamental definitions and laws; resistive circuit analysis; mesh and nodal analysis; RL, RC, and RLC circuit analysis; DC/AC analysis; Thevenin and Norton theorems.

Co-requisite: ELEN 202 Pre-requisites: ELEN 201, MATH 200, MATH 211

ELEN 222 SIGNALS AND SYSTEMS THEORY

This course covers continuous-time and discrete-time signal transformations and system classifications; Linear Time Invariant system analysis (convolution and ordinary differential/difference equation); Fourier series; Fourier transform; Laplace transform; and z-transform.

Pre-requisites: ELEN 221, MATH 270

ELEN 223 ELECTRICITY AND ELECTROMAGNETISM

This course introduces electrical engineering students to static electric and magnetic fields basic laws such as Coulomb, Faraday, Gauss, Ampere, Biot-Savart, and boundary conditions which leads to the ability of deriving Maxwell's equations. In addition, deep theoretical insights will be given to electromagnetic related issues such as energy, potential, current, magnetic force/torque, magnetic vector potential, and magnetic circuits.

Pre-requisites: ELEN 221, MATH 202, MATH 270

Extract from FOE Catalogue 2023/2024 version 5.0

ELEN 231 ELECTRONICS I

This course covers the physics and operation of semiconductor devices such as diodes and transistors. It also covers two-port networks, small-signal models, operational amplifiers, and circuit analysis at intermediate frequencies.

Pre-requisites: ELEN 221

ELEN 303 CIRCUITS ANALYSIS LAB

This laboratory prepares students to verify the basic laws of circuit analysis by designing, analyzing, and implementing DC/AC networks.

Pre-requisites: ELEN 221

ELEN 304 ELECTRONICS LAB

This laboratory provides practical experience in telecom through a series of experiments in analog communications and illustrates various methods of modulation/demodulation of an information signal, namely, AM, DSB, SSB, FM, and stereophonic FM.

Pre-requisite: ELEN 231

ELEN 306 TELECOMMUNICATIONS LAB

This laboratory work includes oscillators, AM, FM modulation and demodulation, detectors, phase locked loops, AM receivers, ASK, PSK modulators and receivers; effects of white noise on binary signals; signal degradation and filtering; fiber optics.

Pre-requisite: ELEN 341

ELEN 307 CONTROL LAB

This laboratory analyses, simulates, and designs LTI systems and then verifies experimentally. It primarily determines the time constant of a 1st order, the dampness of a 2nd order, and the stability of a 3rd order systems. The students design and build analog computers to emulate real physical systems. The lab also covers the design and implementation of classical and modern controllers (PID, phase compensation, SFC). The students use MATLAB/Simulink and NI Multisim for simulation. They also use Quanser's Rotary Servo and Ball-and-Beam modules to model, design, simulate, and implement control systems.

Pre-requisite: ELEN 350

ELEN 308 ELECTRIC MACHINES LAB

This laboratory covers electric machines where the students tend to do electrical and mechanical measurements and basic operation characteristics of transformers (single and three phase), DC machines used as motor and as generators and AC machines (induction and synchronous).

Pre-requisite: ELEN 361

ELEN 324 CIRCUITS ANALYSIS II

This course covers characteristics of sinusoids; phasor relationships; instantaneous and average power; RMS values, complex power, and power measurements; Three-phase Circuit Analysis, magnetically coupled networks; ideal transformers; frequency response; MultiSim applications of all topics.

3.0: 3 cr. E

0.3: 1 cr. E

Pre-requisites: ELEN 221

ELEN 325 ELECTRICAL INSTALLATIONS

This course exposes students to residential and industrial wiring systems and techniques in conformance with the National Electrical Code (NEC) and local codes.

Pre-requisite: ELEN 303

ELEN 326 DIGITAL SIGNAL PROCESSING

This course covers sampling, quantization, and reconstruction of signals; Discrete Fourier Transform (DFT); z-transform analysis. It also introduces the design of IIR, FIR, and recursive digital filters by transforming a suitable continuous filter (Butterworth, Chebyshev type I and II) to satisfy the given digital specifications (Impulse Invariant method, Bilinear Transformation).

Pre-requisite: ELEN 222

ELEN 332 ELECTRONICS II

This course covers the behavior and operating limitations and efficiency of operational amplifiers, multistage amplifiers, current mirrors, feedback amplifiers, power amplifiers, low and high-frequency amplifications, active filters, and large-signal and small-signal behavior and limitations of differential amplifiers.

Pre-requisite: ELEN 231

ELEN 340 SIGNAL TRANSMISSION

This course covers the principles of field theory. Topics include solution of boundary value problems in electromagnetic using both analytic and numerical techniques; transmission line concepts; Smith charts and design tools for distributed circuits; conducting and dielectric guiding structures for waves; radiation from antennas; low frequency applications.

Pre-requisite: ELEN 223

ELEN 341 TELECOMMUNICATIONS

This course covers the principles of bandpass analog communication; linear demodulation AM, DSB, SSB, VSB; envelope detection, coherent/non-coherent demodulation, super-heterodyne receiver; angular (nonlinear) modulation, Phase Modulation (PM), Frequency Modulation (FM), angular demodulation, different types of discriminators pre-emphasis and de-emphasis, and performance analysis using Signal to Noise Ratio (SNR), and Frequency Division Multiplexing (FDM). It also involves the study of some baseband digital signaling such as the pulse modulation, PAM, PWM, PPM, PCM, Line coding, and Time Division Multiplexing (TDM).

Pre-requisites: ELEN 222, MATH 246

ELEN 349 INTRODUCTION TO CONTROL SYSTEMS

This course covers continuous-time signal types and transformations; system classifications and analysis in both time and frequency domains; Laplace transform pairs, properties, and applications; Linear Time Invariant real physical dynamical continuous-time systems analysis such as convolution and ODE; block diagram algebra and signal flow graph; stability analysis techniques (Routh-Hurwitz stability test); state space analysis; classical control systems design (PID and phase compensation).

Pre-requisites:

- For Electrical Engineering Students: MATH 270, ELEN 202, ELEN 221
- For Mechanical Engineering Students: MATH 270, MECH 241, MECH 231

ELEN 350 CONTROL SYSTEMS 3.0: 3 cr. E

This course covers control systems analysis and design; block diagram algebra and signal flow graph; stability analysis and the Routh-Hurwitz stability test, root locus, time and frequency domains design criterion; Bode, Nyquist, and Nicholas plots; Gain and Phase Margins; classical control design (PID and phase compensation); state space analysis and design.

Pre-requisites: ELEN 222

ELEN 351 DIGITAL CONTROL SYSTEMS

This course covers discrete-time Linear Shift-Invariant (LSI) real physical dynamical system analysis and discrete control systems design; discrete-time signal conversion and processing; sampling theorem; stability analysis techniques (Jury stability criterion); root locus; z-transform; discrete equivalents; classical (PID, phase compensation) and modern (state feedback) discrete-time control systems design.

Pre-requisite: ELEN 350

ELEN 360 ELECTRIC MOTORS AND DRIVES

This course covers the fundamentals of electromagnetic circuits; AC three-Phase Circuits; Construction and operation: fundamentals of AC machines, operation of Synchronous generators; induction motors: construction and principle of operation, power, torque, and efficiency; AC drives: starting and speed regulation, plugging and regenerative breaking; DC motor types and control strategies, stepper motors: types, operational characteristics, drivers configurations.

Pre-requisites:

- For Electrical Engineering Students: MATH 211, ELEN 221
- For Mechanical Engineering Students: MATH 211, MECH 231

ELEN 361 ELECTRIC MACHINES

This course covers Faraday's law applied to magnetic circuits and transformers; per unit system; energy balance and electromechanical conversion processes; analysis of reluctance machines; three-phase and single-phase induction motors; synchronous motors and generators; DC motors and generators; fractional horsepower motors.

Pre-requisites: ELEN 223

ELEN 362 POWER ELECTRONICS

This course covers the applications of power semiconductor devices; circuit analysis; signal analysis and energy of AC/DC, DC/DC, DC/AC, AC/AC conversions. These generic converters are applied as controlled rectifiers, switching power supplies, motor drives, HVDC transmission, induction heating, and others.

Pre-requisite: ELEN 231

3.0: 3 cr. E

3.0: 3 cr. E

ELEN 400 LINEAR SYSTEMS

This course covers the concepts and theories of linear system analysis; state-space modeling and analysis; controllability, observability, and stability of linear systems; properties of transfer function matrices: minimal realization.

ELEN 401 OPTIMIZATION THEORY

This course is an introduction to various methods of obtaining the extreme of a non-dynamic or a dynamic system and its use in system design. Linear programming, various search methods, nonlinear programming and dynamic programming are also covered. Various real-life applications are discussed and appropriate case studies are investigated.

ELEN 402 STOCHASTIC THEORY

This course covers general concepts of stochastic processes; stationarity and ergodicity; stochastic continuity and differentiation; Gaussian process; linear systems with stochastic inputs; correlation functions and power spectra; matched filtering; mean square estimation; spectral estimation; modulation; Entropy; Markov processes; queuing theory.

ELEN411 MECHATRONICS SYSTEMS

The course covers interdisciplinary topics that integrate electronics, computer, control, and mechanical engineering to create complete electromechanical systems. It covers sensors and transducers; electrical and mechanical actuators; systems modeling and signals conditioning; analysis and identification of discrete-time dynamic systems; commonly used digital controller design methods; closed-loop control and microprocessor-based switching control.

ELEN 417 MEASUREMENT SYSTEMS

This course covers sensors and transducers as well as electrical and mechanical actuators. A wide variety of sensors is covered in the first part of the course: temperature, humidity, pressure, strain, motion, proximity, optical and ultrasonic sensors, current, voltage, etc. Some communication protocols (UART, I2C, SPI, 1-wire, etc.) used by sensors are briefly outlined in the second part of the course. This necessitates the use of microcontrollers to measure data and hence the course will delve into this area from a data acquisition point of view. The course also emphasizes control systems in which measurements are made, data are processed, and actuators are triggered in order to service an industrial process or a home automation control application.

ELEN 435 ADVANCED ELECTRIC MACHINES

This course covers the generalized theory of machines based on coupled circuit approach using matrix methods; transformations from stationary to rotating reference frame; applications to dc induction, and synchronous machines and their parameters; performance in the transient and the steady state.

ELEN 437 POWER SYSTEMS I

This course enables students to model the elements of a power system including transformers, rotating machines and transmission lines using the per unit system and sequence impedance networks derived from the use of symmetrical components. Power flow analysis will be studied utilizing the system model. Matrix methods for solving network problems utilizing modern tools will be used throughout the course.

ELEN 441 INFORMATION THEORY AND ERROR CORRECTION

This course deals with orthonormal expansions, effect of additive noise in electrical communications, vector channels, waveform channels, matched filters, bandwidth, and dimensionality. Optimum receiver structures, probability of error, bit and block signaling, introduction to coding techniques. Protocols for error control, signaling, addressing, fault management, and security control. Block, cyclic, and convolutional codes; circuits and algorithms for decoding; application to reliable communication and fault-tolerant computing.

ELEN 443 DIGITAL COMMUNICATION

This course treats the principles of digital transmission of information in the presence of noise where it starts with an overview of information theory and coding; analog to digital conversion; design and analysis principles of baseband PAM transmission systems; M-ary signaling; various passband carrier systems including ASK, FSK and PSK; multiple access schemes (2G TDMA, 2G CDMA, 3G WCDMA, 3G TD-CDMA, 5G BDMA). Receiver design in the presence of AWGN noise is presented at the end of the course with special focus on match filters; maximum likelihood detectors; link budget analysis in terms of QoS metrics such bit error rate and channel capacity. It also covers an introductory treatment of channel coding.

ELEN 446 TELECOM ELECTRONICS

This course covers applications of operational amplifiers and other integrated circuits in current technology; wide bandwidth amplifiers; low-noise amplifiers; current mode circuits; analog multipliers; radio frequency input circuits and impedance matching; RF amplifiers; micro-strip circuits; IF circuits; oscillators; Phase locked loops (PLLs).

ELEN 459 ENGINEERING IMAGE PROCESSING

This course helps to interpret the content of an image by improving the pictorial image information interpretation and processing of seen data for autonomous machine perception. Topics covered include: Image acquisition and storage, image transformation, image enhancement in frequency and special domains, representation and description of a seen, recognition and interpretation.

ELEN 462 BIOMEDICAL INSTRUMENTATION I

This course covers the concepts and applications of biomedical instrumentation; basic transducers and principles; amplifiers and biomedical signal processing; origin of bio-potentials; electrodes and amplifiers; blood pressure and sound; measurement of blood flow and volume; measurements of the respiratory system parameters; clinical laboratory instrumentation; electrical safety.

ELEN 463 MEDICAL IMAGING I

This course provides an introduction to the physical principles and functions of Ultrasound (Interactions, Propagation, Attenuation, sensitivity, transducer construction, Focusing, 2D/3D, Arrays, Image reconstruction, etc.) and X-ray Diagnostic Radiology such as X-ray Computed tomography (including Image reconstruction), Mammography, etc. Other related issues will also be discussed.

ELEN 466 INDUSTRIAL INTELLIGENT NETWORKS

This course covers industrial networks and their applications such as advanced set of PLC problems covering a wide range of systems; MODBUS RTU protocol and its use in industrial automation; PLC communications; ethernet-based industrial networks such as MODBUS/TCP; home automation (KNX/DALI).

3.0: 3 cr. E

3.0: 3 cr. E

3.0: 3 cr. E.

3.0: 3 cr. E

3.0:3 cr. E

3.0: 3 cr. E

ELEN 472 FIBER OPTICS

This course covers the principles of fiber optics communication systems; optics review; Light fundamentals; integrated optic wave guides; light sources, detectors, and couplers; distribution networks and fiber components; modulation; noise; system design; measurement.

ELEN 480 FIELD TRAINING

This course requires students to undergo a two- to four-month training program at an institution whereby they get exposed and engaged in activities related to their field of studies, thereby gaining experience and demonstrating their skills.

ELEN 523 OPTIMAL CONTROL SYSTEMS

This course covers the analysis and design of modern feedback control systems; advanced state space analysis; Popov-Belevitch-Hautus (PBH) tests; Cayley-Hamilton theorem; Ackerman's formula; state feedback control design and the Kalman gain; state estimation and the identity and Luenberger observer design; optimal control design (LQR); Hamiltonian and Riccati equations; analytical control system design.

ELEN 525 MOBILE ROBOTS

This course covers inspiration to implementation of mobile robots: Computational hardware, designing and prototyping, sensors, mechanics, motors, power, and robot programming.

ELEN 527 FUZZY LOGIC CONTROL

This course covers analysis and design of adaptive fuzzy systems: Training of fuzzy logic systems using backpropagation, orthogonal least squares, table lookup scheme, Nearest neighborhood clustering; Comparison of adaptive fuzzy systems with artificial neural networks; Design using input-output linearization concept; fuzzy adaptive filters.

ELEN 536 POWER SYSTEMS CONTROL

This course presents the transient, dynamic, and static stability and control of power systems represented by a Single Machine Infinite Bus (SMIB); synchronous generator models; nonlinear swing differential equation; definitions of transient stability and the equal-area criterion; the Phillips-Heffron linearized model of a synchronous machine; Power System Stabilizer (PSS); the Load Frequency Control (LFC); the Automatic Voltage Regulator (AVR); steady-state voltage stability and control.

ELEN 537 POWER SYSTEMS II

This course presents symmetrical and unsymmetrical fault studies; bus impedance and admittance methods; power system controls; transient operation of transmission lines; transient stability; computer projects included.

ELEN 539 POWER QUALITY

This course covers electric power quality; measures and standard of power quality measurements; modeling of networks and components under non-sinusoidal conditions; loads which may cause power quality problems; analysis methods, harmonics in power systems; and power quality improvement are covered.

ELEN 542 WIRELESS COMMUNICATION SYSTEMS

This course aims to present wireless communication systems in general. It is a graduate course that covers several aspects of wireless communication starting from the general concepts and going towards specific wireless networking protocols. Different propagation models, modulation techniques, multiple

3.0: 3 cr. E

0.0: 3 cr. E

3.0: 3 cr. E

3.0: 3 cr. E

access approaches will be deepened. Speech coding and data transmission approaches will be introduced. Examples on the GSM, DECT and satellite communication will be given. As a result, the students will have a good knowledge of the most common wireless communication systems which permits them to easily start any study in this area.

ELEN 544 SPEECH TECHNOLOGIES

Speech is the most natural way of communication. Classical telecommunication systems have been built to carry this signal. Nowadays, speech is a major media in human-machine communication. Besides, the classical and basic studies on speech coding, new speech technologies have been developed, i.e. speech synthesis, speech recognition and speaker verification. This course presents the state-of-the-art techniques. It starts with a brief presentation of the signal and of the most widely used coding techniques. Concatenative speech synthesis is then described in detail. State of the art Speech recognition systems are also presented covering Hidden Markov Models (HMM).

ELEN 562 BIOMEDICAL INSTRUMENTATION II

This course covers selected topics on the major medical equipment: Blood pressure and sounds, Blood flow, respiratory measurement instruments, Biochemical parameters measurement instruments. In-hospital visits and observation are included in the course.

ELEN 564 MEDICAL IMAGING II

This course provides an understanding on the principles of Magnetic Resonance Imaging (Spins, MDM, Tissue contrast, image formation, Artifacts), and Nuclear Medicine (SPECT, PET, Planar, etc.). Also issues such as reconstruction algorithms, Image quality will be addressed.

ELEN 572 SATELLITE AND RADAR COMMUNICATION

This course is designed to provide students with an understanding of the working principles of satellite communications and the technologies involved. Topics covered include: introduction to satellite and radar communication, orbital aspects of satellite communication, satellite link design, multiple access methods (FDMA, TDMA, CDMA, FCMA), and systems examples (satellite TV, VSAT applications, mobile to satellite communication).

ELEN 574 OPTICAL WDM NETWORKS

This course is designed to provide students with an understanding of the working principles and challenges of optical networks. Topics covered include: Enabling technologies and building blocks, single-hope networks, multihop networks, optical access networks (like PON, EPON and WDM PON), optical metro networks (including interconnected WDM ring networks and packet communication using tunable WADM), wavelength- routed networks (including routing and wavelength assignment strategies, light path establishment: static (SLE) and dynamic (DLE), fixed and adaptive routing and wavelength assignment strategies using heuristics).

FACULTY OF ENGINEERING GENERAL COURSES

GENG 221 ENGINEERING ETHICS

This course introduces and reinforces the concepts, theories, and practice of engineering ethics and aims at providing basic knowledge of ethics for engineers in different types of work roles. It prepares the engineering students for identifying, taking responsibility for, and finding solutions to potential ethical problems/cases. It provides students with an interactive study of ethical theory and the development of professionalism and helps them think more clearly and deeply about ethical issues of the natures that engineers often face in professional practice, and explore resources, strategies, and options for dealing with such complications. Students review case studies of ethical conflicts in engineering practice. The course also covers engineering codes of ethics and requires students to resolve theoretical situations through the application of ethical codes.

(A core BS course as of 2023/24 to replace a CSPR XXX course for students who started from year 2022/2023. Previous students can take it as an equivalent of a CSPR XXX course if they have not already taken the required 3 CSPR XXX courses)

Pre-requisite: CHEN/CIVE/ELCP/MECH/290 (according to discipline), ENGL 203

GENG 222 SUSTAINABLE DEVELOPMENT FOR ENGINEERS

This course introduces the fundamental and advanced concepts of sustainable development. It transitions students' understanding of the UN Sustainable Development Goals (SDGs) to focus specifically on the critical role of engineers in achieving these SDGs. Students should then be able to resolve problems by adopting sustainability principles, which should in turn reflect on the students' multidisciplinary design ability to ensure a proper sustainable design process to improve and preserve the quality of life for future generations.

(A core BS course as of 2023/24 to replace a CSPR XXX course for students who started from year 2022/2023. Previous students can take it as an equivalent of a CSPR XXX course if they have not already taken the required 3 CSPR XXX courses)

Pre-requisite: CHEN/CIVE/ELCP/MECH/290 (according to discipline), ENGL 203

GENG 311 ENGINEERING MANAGEMENT AND ECONOMICS

Engineers with excellent managerial skills and superior economic acumen are needed as leader of the new century engineering world. This course prepares engineers to fulfill their managerial responsibilities and acquire useful economic perspectives. This course is organized to contain two major parts: (I) Functions of engineering management, and (II) Economic fundamentals for engineering managers. Part (I) introduces the basic functions on engineering management such as planning, organizing, leading and controlling, while part (II) covers the fundamentals of engineering economics.

GENG 400 ENGINEERING SEMINARS

This module consists of lectures and seminars covering recent research and advances in various fields and applications of engineering disciplines.

3.0: 3 cr. E

2.0: 1 cr. E

16

3.0: 3 cr. E

GENG 402 PROJECT MANAGEMENT

To make available the fundamentals of project management with the most workable types of organizations and the necessary capabilities that must be included to reasonably ensure success and minimize the possibility of failure. The course consists of construction contracting for contractors, owners, and engineers: bidding, industry structure, types of contracts, and delivery systems of construction, planning, estimating, quantity take-off and pricing, labor and equipment estimate, proposal preparation, contract documents to prepare detailed estimates, permits, risk management, and taxes. Basic critical path planning and scheduling with activity on nodes and activity on arrows, monitoring, updating, controlling, crashing, resource leveling, resource allocation, and least cost scheduling including time-cost trade-off analysis. Computer applications using the Primavera software.

GENG 490 GRADUATION PROJECT

An approved final design project.
